19. Course Description:

As stated in the approved study plan.

Application of advanced mathematical techniques, including ordinary and partial differential equations, linear and nonlinear algebraic systems, and methods for solving boundary value problems. Development of dynamic and steady-state models for chemical and physical processes, incorporating transport phenomena, reaction engineering, and process control. Linearization, perturbation methods, and eigenvalue analysis applied to process modeling. Dimensional analysis for scaling and simplification of models. Parameter estimation, model validation, and sensitivity analysis. Use of computational tools and numerical methods for solving complex process models, including finite difference and finite element methods.
